

System Configuration Files

System configuration files (*.scf) use the following basic syntax—expressed in EBNF:

```
component ::= "[" identifier "]"
property ::= "{" identifier "=" option (";" option)* "}"
option ::= (Default | User | Disabled)

Default ::= "DEFAULT" ":" definition
User ::= "USER" ":" definition
Disabled ::= "DISABLED"

comment ::= ";" text
```

Typical Uses

System components are identified by square brackets, and the settings of the component properties are specified between braces under that section.

The following table provides a few typical examples.

Type	Examples
Component definition	[system]
	[database]
Property definition	{blocksize = SYSTEM: 4096; USER: 1024}
	{user_count = DEFAULT: 50; USER: 150}
	{disks_aligned = true}
	{cloud_use = DEFAULT: Local}
	{self_certificate_use = DISABLED}
